ATTENDEES

Seán O'Callaghan, Viktor Zamaraev

SYNOPSIS

Foremost-time implementation discussion.

NOTES

Edge-stream; multiple edges of the same source-sink pair. Can't model standalone nodes if input is an edge list. Multiple constructors for graph creation? Need validation to ensure nodes & edges actually form a proper graph (by construction). The algorithm should produce a foremost-tree, which has the foremost-path from the root node to all other nodes in the graph.

ACTION ITEMS

Continue implementing the foremost-path algorithm.
